## Activity 8: Color Differences

# Goal

To tabulate color difference between patches under two light sources using CIE 76DE and the DE in Chroma and Hue

## Differences

These are the values greater than 2.3. A lighter shade can be observed when you focus on it. To be honest, it's really hard to differentiate it.

## D65, D55

The chosen pair of light source is D65 and D55. I tried to get all possible combination but will focus on this pair. The next slide will show you the importance of delta E to see the differences in color. As explained, for something greater than 2.3 we expect a larger difference.

## D65, D55

Most pairs are not noticeable which is expected as the value is below 2.3. For patches with higher than 2.3, we can see a slight change from the expected color. Most of them have lighter shade. Although, an error in patch #1 can be observed.

## Incandescent, fluorescent

So far, this has been showing larger obtained values. If I do something similar to my first pair, a large difference will be observed.

## Summary

I tried to see my work in another's laptop. It's all different when you check it. The colors changes. For the many errors, we can take into account the capacity of a laptop screen. Also, the values are so close. It's hard to pinpoint the differences especially if we're talking about a minimal difference in shade. So far, a combination of a incandescent and fluorescent is not a good combo. A large difference in color will be observed.

The activity was fun, but a bit tedious to code. Also, the colors are hard to differentiate so I wouldn't enjoy making another activity like this. Although, I've learned a lot especially I'm into photography and videography. Choice of light really matters. The colors are we choose can change depending on the light.
